SOFTWARE SOLUTIONS

Edition No 97   October 2017

Number	Application	Description
9701	**Sales / Purchase**	**Statement Print to Email** If sending an automatic statement, or more generally any document, to email then if the email address defaulted from the account was invalid and Outlook could not resolve it to an email address then Datafile could report an EStringList error.
9702		**Debtor Memo on Aged Analysis Report** If include the content of the debtor memo on the Aged Analysis report the system word wrapped on a shorter length than in V6.
9703		**Change Due Date / Allow Mixed Allocations** If the option to allow mixed allocations in use then this option didn't show the forward transactions incorrectly (V6)
9704		**Change Due Date / Multiple Entries** If change due date on first transaction then focus moved to second entry but the edit focus remained on the first entry.
9705	**Stock Control**	**Component Stock Check—Report Order** The Component Stock Check report will now display the stock codes in component entry order.
9706		**Statements Over 1 Page** If processing stock statement the system creates a page break on change of stock code. If the stock transactions for any one stock code exceeded page length didn't create page break for these additional transactions. (V6)
9708	**Payroll**	**Auto-Enrolment—Minimum Contribution Rates** If using auto-enrolment functions the payroll input, check report and payroll run report will not apply checks that the employer contribution percentage and the combined employee/employer percentages match the minimum contribution thresholds. (V6)

9709	Job Costing	**ERangeError in Job Costing Stock Issues** If cost code used didn't have a cost category set was possible to get an ERangeError on update to the job records—system will now validate that cost code invalid prior to update and ask the operator to update. (V6)
9710		**Transaction Report—Budget Totals** The Budget totals were included on this report incorrectly and would report either 0 or an uninitialized value. Now omitted (V6)
9711	Order Processing	**Output Pick List Grid to Excel** If pick list grid set to use colours then if more than one colour applies the Excel output could omit highlighted rows
9712		**Update of Cost Price with Cost Per** When updating the cost price on Stock the system used the cost per from the stock record—will now take into account the cost per on the purchase order also (V6)
9713		**Change Status—Direct Call** If call the Change Status function using the direct call parameter and change status from Quote to Active then system prompts to update the details. The detail screen displayed used the older ADD/CHANGE/FAST options rather than DETAILS when configured for pick list entry. In addition system could stick in the order reference input on return to status change screen (V6).
9714		**Replicate Order—Direct Call** If called the replicate order function from its direct menu parameter then the detail screen display ADD/CHANGE/FAST incorrectly when configured for Detail Pick mode (V6)
9715		**Update of Sales Price on Stock Transactions** If Foreign Currency System Profiles not set to multiply stock prices by rate then when writing to the stock transactions the base currency sale price was as per the rate at order entry rather than the rate applied on delivery.
9716		**Order Entry and Stock Alerts** If Alerts configured against stock record to record when, for example, stock falls below minimum, then SOP Order Entry would not trigger and alert when should do.
9717	Datafiler	**List Records / X-Close** If used the X-Close option on the Items to List display the system continued to list the records rather than exit to the menu.

9718	Manager	**Recalculate Account Outstanding Value** If user has an alert on the sales account record that credit limit is less than account balance plus outstanding orders then this process zeroes the account outstanding value and then rebuilds for the orders. If this process generates an email alert and the terminal in question has no email client then would report an error. Will now ignore the email alert for this option if Outlook not in use.
9719	General	**Application Locks within DIAMOND.D02** The system will now not include paths when saving the company file names in the D02. (V6)
9720		**Error Accessing DIAMOND.D05 (X5)** System will now retry up to five times on this error (where DF tries to read the DIAMOND.D02 on the network and the network read fails) and if still fails will report an error in network communication. (V6)
9721		**METROPOLIS Colour Scheme** If used the Metropolis colour scheme then pick list grids could display incorrectly where small volume of records to display.
9722		**Report Parameter Screens** Changes have been made to prevent the user clicking entries during report building procedures.
9723		**Sign Off** If exit completely from Datafile then the system remembered the last application in use and focused on this when sign back on. If user used the sign-off procedure and signed back on didn't remember the last application used.
9724		**Printer Driver Memory Allocation** When DF opens a printer it stores the driver settings in memory—if the driver size exceeded the allocated memory then the system noted this in the SYSERR.DAT. Maximum memory allocated for the printer driver has now been increased.
9725		**FONTSIZE= Setting** Datafile 2017 ignores this entry within the DATAFILE.INI that was used to increase the font size settings in V6, applying the OS font sizing and scaling tools. If set to FONTSIZE=0,0,0 though this distorted the view within the Ledger Enquiry—this now ignored.
9726		**Ledger Enquiry Transactions—More / All** If user used the page-down key to trigger the more option when the pick list limit is reached V6 would report an access violation. (V6 only)

9727	**General**	**Screen Dump to Printer** If used the options to print screen the system displayed the main form rather than the current sub form.
9728		**Stock Enquiry / Memo's** If using location stock then if swap location from one stock item to another then if memo existing on the second location the system didn't display the usual memo warning.
9729		**Recursive Menus** The if an option on the main menu called a application menu which looped back to calling the main menu then system would report an error when displaying the full menu tree—will now omit any calls on a menu that calls an menu already open 'higher' in the list.
